

## Thermostats

**Patented  
Bimetal  
Isolation**

- *Patented design positions bimetal sensor for superior temperature sensitivity*
- *Wiring terminals ensure positive connection*
- *High limit feature provides improved safety*
- *For commercial and residential applications*
- *Custom calibrations available*
- *UL and CSA approved*

### Accurate, Reliable, Superior Sensitivity and Control

Engineered to be more sensitive and accurate than conventional thermostats, APCOM water heater thermostats are the most popular in the industry. Our patented design encapsulates the bimetal thermostat sensor, protecting it from the temperature changes of other components. This feature means you get a thermostat with enhanced temperature sensitivity for accurate, reliable system control.

We've also designed our thermostats to be remarkably easy to install. Our wiring terminals feature "tear drop" holes that enter into the bind head screw terminal, making it easier to lock the wire into place. This speeds the assembly process, and helps ensure that connections are made properly.

In addition, our limit control/safety override feature automatically trips at 180 degrees to improve safety.

APCOM thermostats come in a wide variety of types, models, sizes, and capacities for residential and commercial water heaters. Thermostats may be custom calibrated for specific OEM applications.

All of our thermostats comply with NEMA standards and are certified as recognized components by Underwriters Laboratories and Canadian Standards Association.
